## How do you read for comprehension

Top-down prediction  
→ Use the context to predict the upcoming words

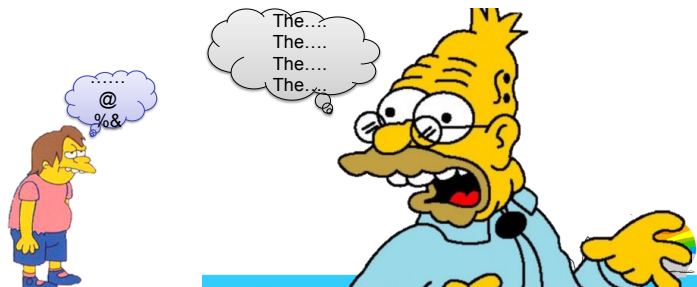

Bottom-up Integration  
→ Integrate the meanings of individual words

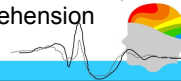

## Aging and Language comprehension

- Aging has been associated with various cognitive declines, including attention, memory and executive function.
- How aging may cause qualitative and quantitative changes in language comprehension?

## Outline

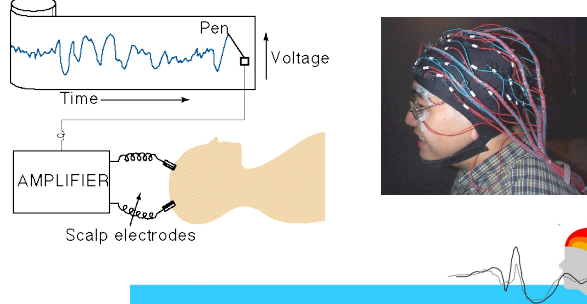

- N400, an ERPs component for semantic retrieval and integration
- ERPs studies for contextual influences
  - Cloze probability (predictability) effect in sentences comprehension
  - Chinese Classifier-noun agreement
    - Semantic constraint effect of classifier
    - Cloze probability effect of noun
- ERPs Data from
  - Young adults (college students),
  - Healthy elders
  - Aphasics with different severity of comprehension impairment

## EEG: Electroencephalography ERPs: Event-related potentials

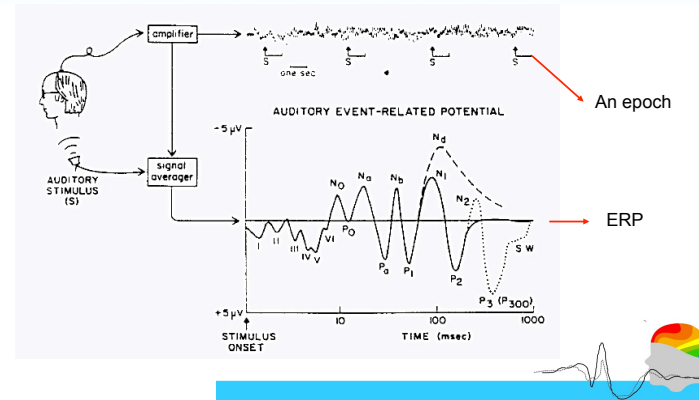

- **Electroencephalography**: a recording (graphy) of electrical signal (electro) from the brain (Encephalo).

Electroencephalography Recording System

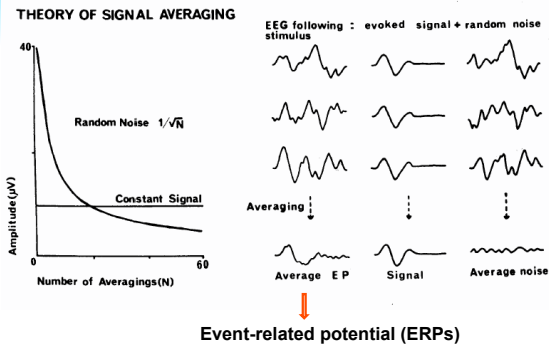

## Event-Related Potentials: ERPs

The time-locked brain potential elicited by a specific event.

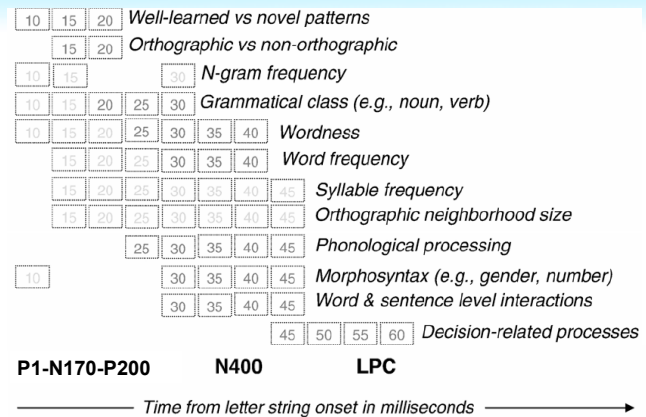

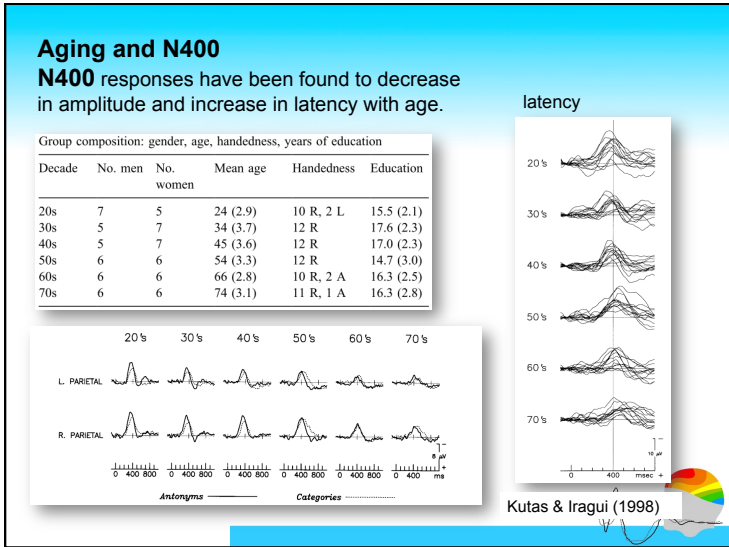

## Theory of Signal Averaging

Electrical activities associated with specific cognitive processes are embedded in EEG and may be extracted by enhancing the signal/noise ratio.

## Time courses of ERP sensitivities during visual word recognition – adapted from Barber and Kutas (2007)

## How to evaluate the contextual effect

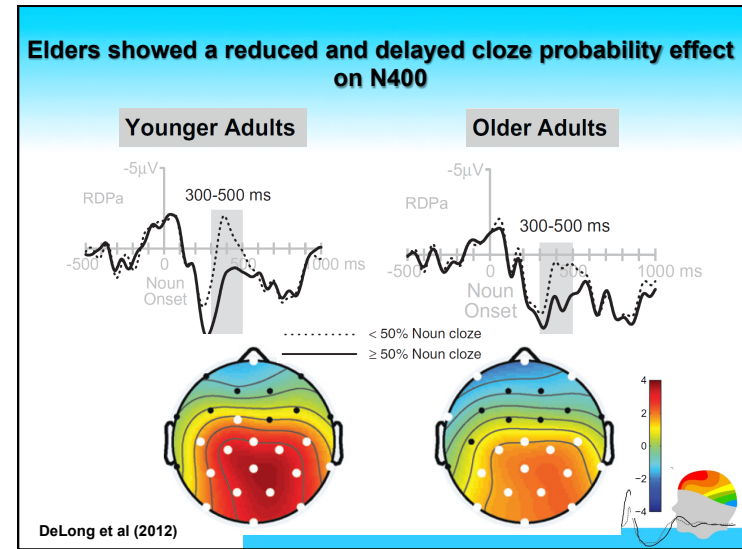

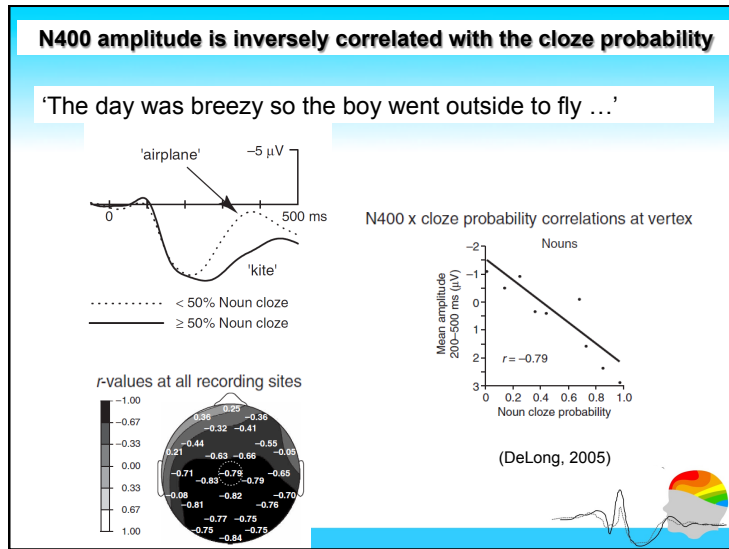

Brain and Language Laboratory

Institute of Linguistics, Academia Sinica

## Cloze probability: An index for language comprehension

Cloze probability of a word refers to the percentage of people who would complete a sentence frame with that particular word, determined empirically (Taylor, 1953).

*He bought her a pearl necklace for her...*      Birthday    cloze=90%  
collections    cloze=3%

### How contextual information influences the visual word recognition

**2 by 2 design ( Frequency X Predictability )**

- High frequency/High predictability (HFHP)
  - 小明平常不注意口腔衛生，現在牙痛發炎，痛得他無法進食
- High frequency/Low predictability (HFPL)
  - 爺爺實在很固執，即使已經牙痛到站不起來，還是不看牙醫
- Low frequency/High predictability (LFHP)
  - 葉片上的水分傳輸，是藉由葉脈以主動或被動的方式傳送
- Low frequency/Low predictability (LFLP)
  - 自然課中藉著帶領小朋友觀察葉脈可以加深他們的學習印象

Lee, Liu, & Tsai (2012)

### Material and Procedure

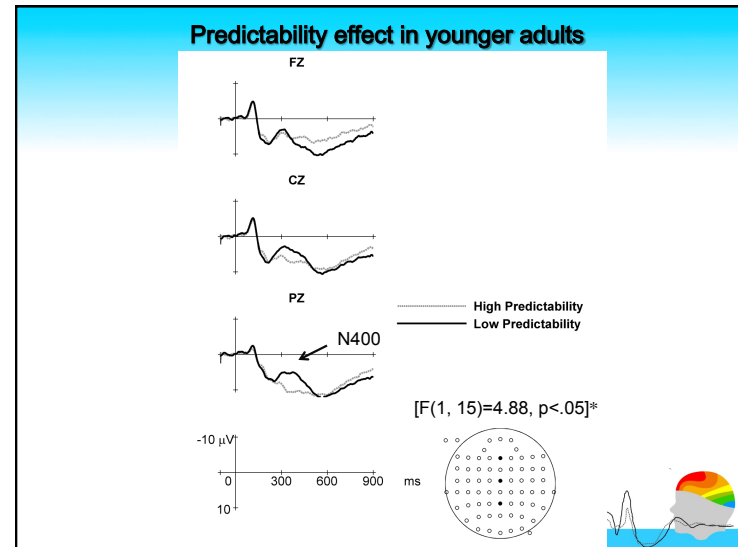

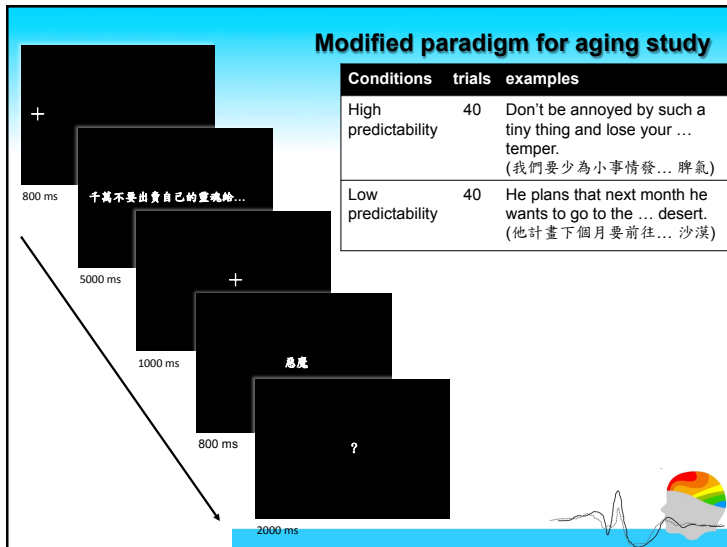

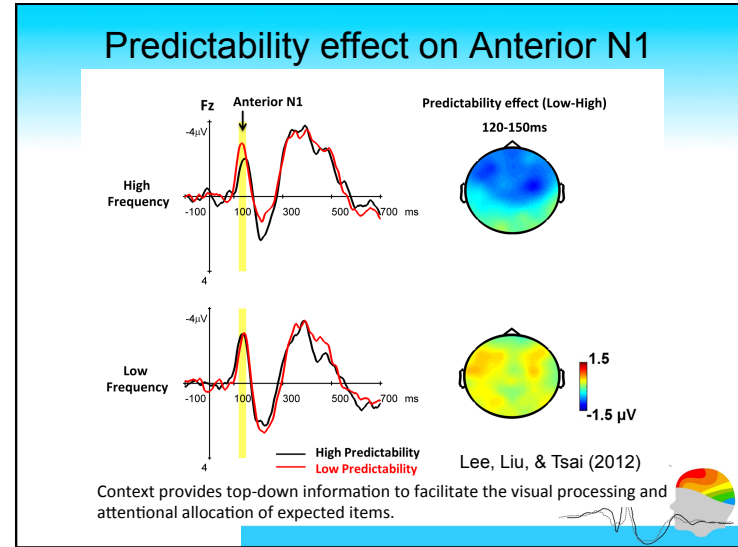

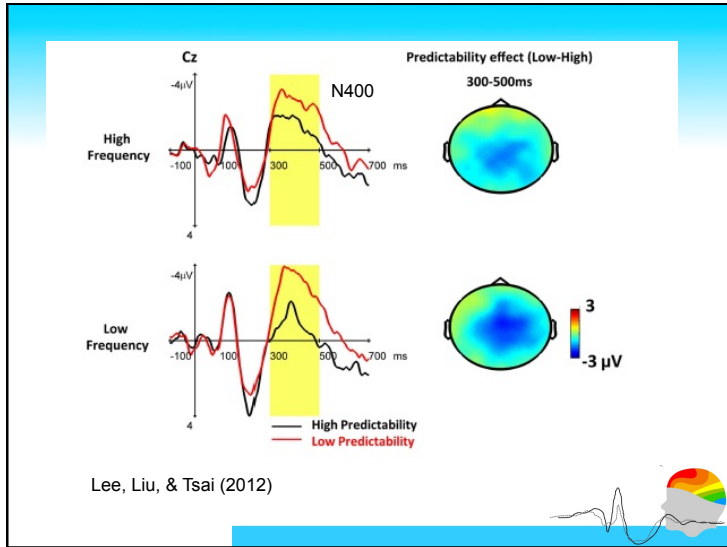

4 conditions, each condition composed of 25 target words ( two characters )  
200 experimental sentences.

	Word Freq	Predictability
High	>500	>70%
Low	<2	<1%

Rapid serial visual presentation (RSVP)  
word-by-word presentation

Target words were located at the middle of sentence.

Randomly follow a comprehension task at the end of sentences. (20% of trials)

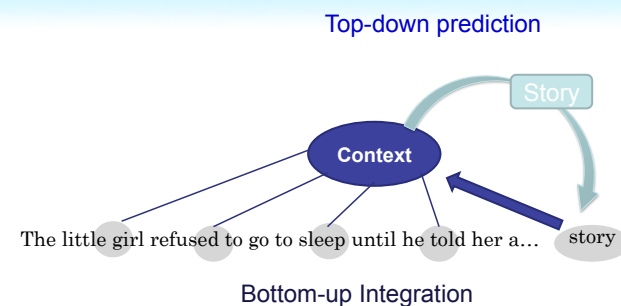

**The predictability effect on N400 is sensitive to the severity of comprehension impairment**

- Young adults
  - typical central-posterior distributed predictability effect on N400
- Elder controls
  - reduced and delayed N400 with central posterior distribution
- Aphasics with high ability
  - reduced and delayed N400 with central distribution
- Aphasics with low ability
  - reduced and prolonged N400 with frontal distribution
  - Multiple cues/resources were used to compensate for their comprehension deficit, so they showed a frontal distributed N400

**To separate two types of contextual effects: Contextual Constraint versus Cloze probability**

The cloze probability effect may be reasoned as:

1. It is easier to integrate the meaning of the high cloze word into the context
2. it is easier to predict the high cloze word based on the context.

### Cloze probability

Cloze probability of a word refers to the percentage of people who would complete a sentence frame with that particular word, determined empirically (Taylor, 1953).

He bought her a pearl necklace for her... Birthday cloze=90%

He looked worried because he might broken his... Arm cloze=36%

### Contextual Constraint

The number of words that can be used to complete the sentences. Sentence constraint influences the range of completions.

#### Strongly constrained:

He bought her a pearl necklace for her... Birthday collection

#### Weakly constrained:

He looked worried because he might broken his... Arm leg, cup, treasure, mirror...collection

### A possible confound between cloze probability and contextual constraint

Edward W. Wlotko, Kara D. Federmeier (2007)

#### Strongly constrained

He bought her a pearl necklace  
for her \_\_\_\_\_  
Birthday **expect** 90.3%  
Collection **unexpected** 3.1%

#### Weakly constrained

He looked worried because he might have  
broken his \_\_\_\_\_  
Arm **expect** 36.2%  
Collection **unexpected** 3.1%

Not well matched!!

### Contextual constraint and Cloze probability effects in sentence reading

Federmeier et. al (2007)

	Sentence frame	Expected	Unexpected
SC	He bought her a pearl necklace for her	birthday	collection
WC	He looked worried because he might have broken his	arm	collection

- A significant interaction between constraint and cloze probability on N400.

### A possible confound between cloze probability and contextual constraint

### Chinese Classifier-noun agreement

```

    NP
    /  \
    DP  Object-NP
    /  \
    Numeral Classifier Noun
    —   條 繩子 (a rope)
    
```

Classifier	Noun (meaning, CP%)
<b>Strongly Constrained (SC)</b> 頂 /ding3/	帽子(hat, 96.55%) 假髮(wig, 24.14%) 王冠(crown, 10.34%) 斗笠(wide-brimmed rain hat, 3.45%)
<b>Weakly Constrained (WC)</b> 瓶 /ping2/	飲料(drink, 72.41%) 水(water, 51.70%) 啤酒(beer, 20.60%) 果汁(juice, 20.70%) 牛奶(milk, 10.30%) 毒藥(poison, 6.90%) 膠水(glue, 3.45%)

### A 2-by-3 factorial design

#### Strongly versus weakly constrained classifier:

Measured by the number of nouns that can be paired by a specific classifier.

#### Cloze probability (CP) of a following noun:

- High cloze (CP>50%)
- Low cloze (CP<6.9%),
- Implausible noun (CP=0%)

Examples of the materials			
constraint (rating)	High cloze	Low cloze	Implausible
SC (3.1)	一通-電話(73.79%)	一架-飛機(4.25%)	一通-戰場/ 一架-國王
WC(4.4)	一瓶-飲料(75.63%)	一條-馬路(3.68%)	一瓶-晚餐/ 一條-首都

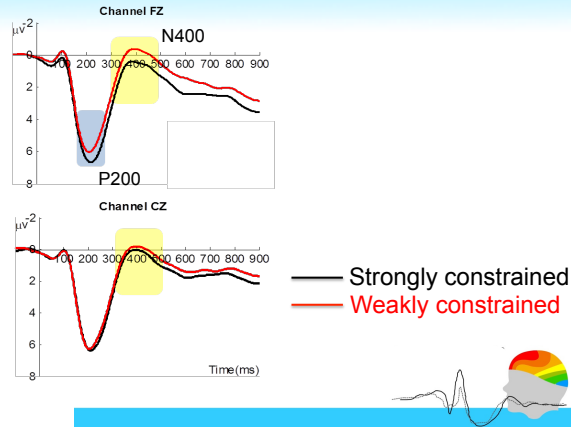

### Procedure

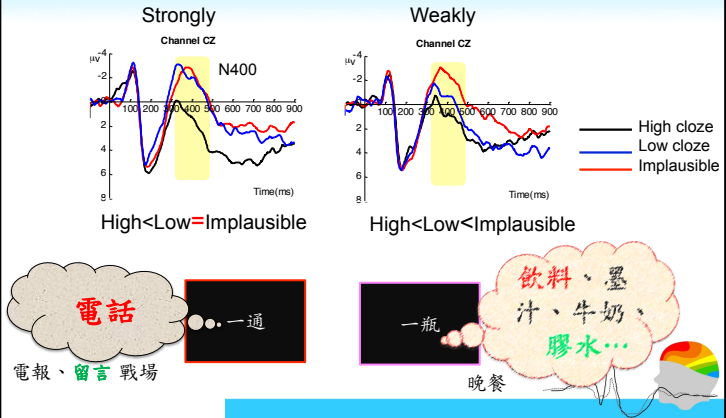

• Constraint effect on **Classifiers**

The constraint effect on P200 and N400

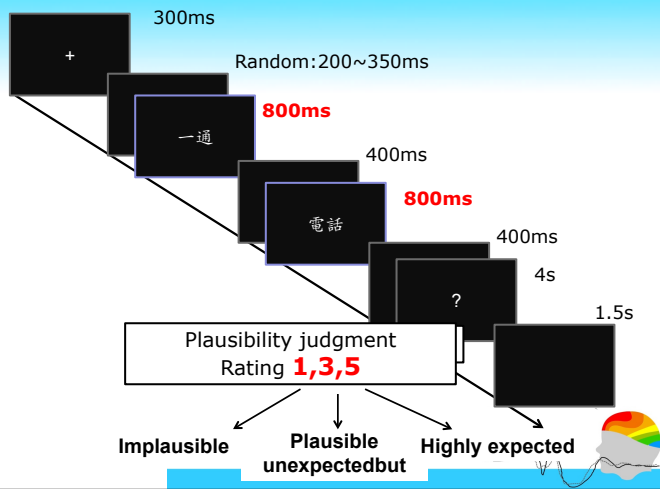

• For the pairing **Nouns**

• An interaction between constraint and cloze probability on N400

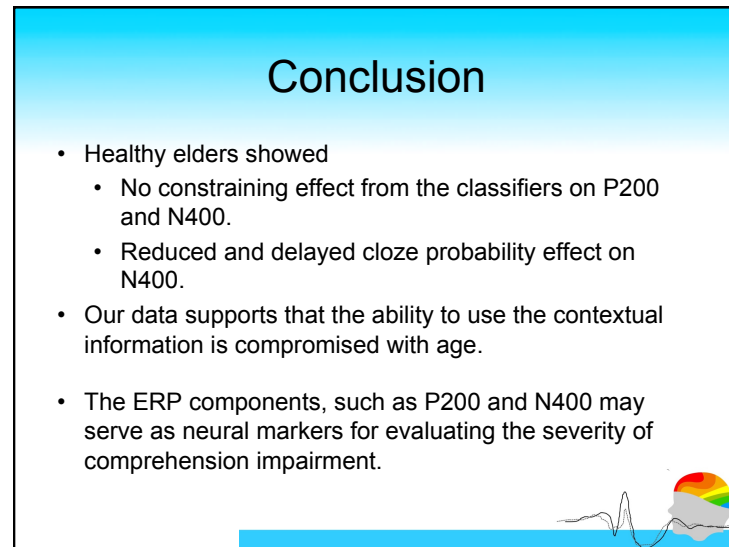

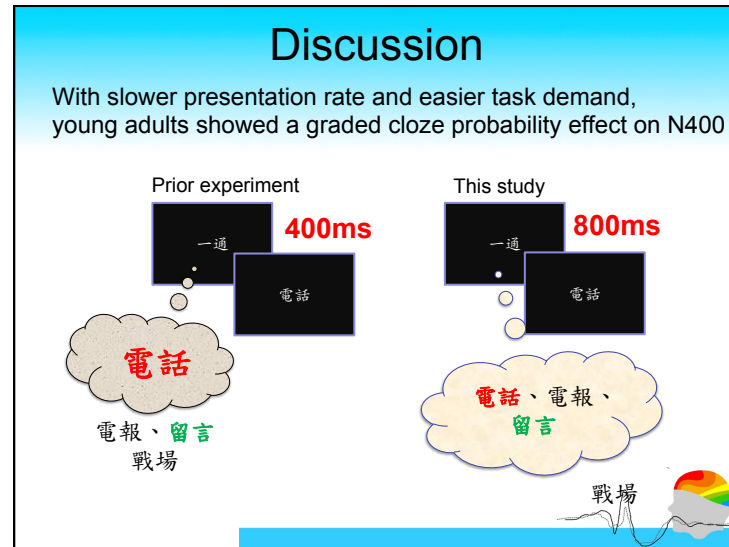

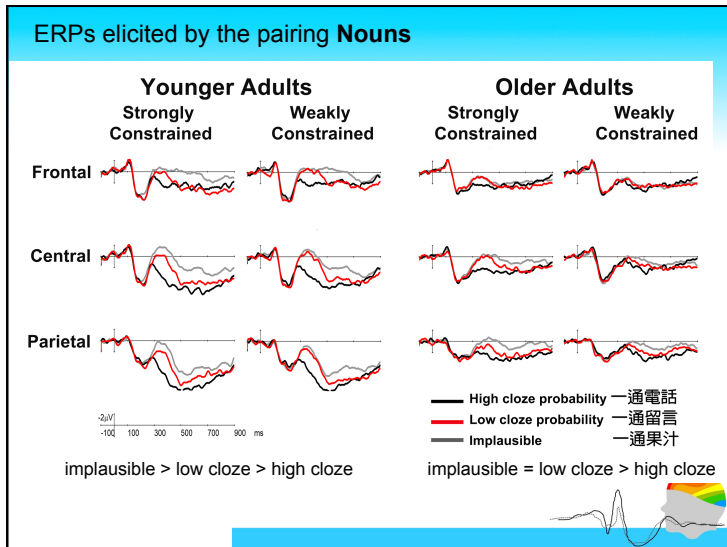

Modified paradigm for elders

• The constraint effect on **Classifiers**

• Only young adults showed a significant **Constraint** effect on N400
